

HOTEL

MANAGEMENT SYSTEM

More Than a Stay,
It's a Memory.

🎥 INTRODUCTION

The hotel management domain deals with managing the daily operations of a hotel such as room reservations, customer records, billing, and room availability. Hotels must handle a large amount of information about guests, rooms, and services every day. Managing these tasks manually can be difficult and may lead to errors or delays. Therefore, computer-based systems are widely used to organize and manage hotel operations efficiently.

🎯 OBJECTIVE

The objective of this project is to develop a simple Hotel Management System using the C++ programming language. The system is designed to manage hotel operations such as room booking, customer records, and billing . It aims to reduce manual work and improve the accuracy of data management. To provide a user-friendly system that allows hotel staff to easily access and manage records.

UNIQUE ROOM EXPERIENCES

🎮 SCOPE OF THE OBJECT

This project focuses on developing a simple Hotel Management System to manage basic hotel operations such as room booking, customer records, and billing. The system will be developed using the C++ programming language with the help of file handling techniques to store and manage data. It will run on a standard computer system using a basic programming environment such as Turbo C++ or any C++ compiler. The project assumes that the system will be used by hotel staff to maintain and update records efficiently in a simple and organized manner.

SYSTEM REQUIREMENT

1. Hardware Requirements

- A computer or laptop with at least an Intel i5 processor or equivalent.
- Minimum 8 GB RAM for smooth execution of the program.
- At least 400–800 MB of free disk space for storing project files and the compiler.
- Standard keyboard for entering user input .
- Monitor or display screen for viewing the system output.

2. Software Requirements

- Windows operating system (Windows 10/11 recommended) because the program uses the windows library.
- A C++ compiler such as Dev C++, Turbo C++, or Visual Studio.
- A basic console/command prompt environment to run the application.
- Standard C++ libraries such as iostream, vector, and iomanip for the program execution.

THANK YOU
